Attractive display package.

Since modern twisted pair cabling must be expected to carry high signal rates, it is necessary to avoid stressing the wire. Tight 90-degree bends are not permissible, and any tie-wraps or other securing straps must not be cinched excessively tight. Care should be taken to avoid routing cables within 18 inches of electrical noise generating devices such as transformers and lighting ballasts. Please see our selection of hook and loop (Velcro) cable ties which are suitable for securing bundles of Cat 5 or Cat 5E cables.

The Category 5 products shown on pages 6 and 7 are stocked items. We have access to many additional items such as patch panels, different styles of outlet boxes, etc. If you have a requirement for an item or items not shown on these pages, please contact us for price and delivery information
